

Worried About Inflation? You Probably Should Be

Over the past decade, inflation has been relatively low. However, it has recently reached levels not seen in decades. While inflation has moderated, it's anyone's guess where it will land. Over time, inflation will erode your purchasing power if the return you earn on your money is less than the inflation rate. There are two inflation rates, reported as the Consumer Price Index (CPI) by the Bureau of Labor Statistics. Headline inflation represents the change in price for a broad bundle of products and services. Core inflation excludes food and energy. Headline inflation is often a better gauge because it reflects all the living expenses consumers have.

So, for every dollar invested in a 6-month CD over the past 10 years, you lost 1.61%. A deposit of \$1,000 would be worth only \$850. It's hard to meet long-term goals with short-term investments. The chart below shows what would have happened to your spending power if you had stayed invested in 6-month CDs for the past 10 years.

Current rates of inflation and CD Yield ⁴

Headline inflation	3.4%
Core inflation	3.9%
6-month CD yield as of 12/31/2023	5.3%

Here is an example of real, after-tax returns on six-month CDs for 2023.

Taxes and inflation determine the real rate of return*

Return for a 6-month CD	5.47%
Minus portion of return used to pay taxes (at a 22% tax rate)	1.20%
Equals after-tax return rate	4.27%
Minus current headline inflation rate	3.40%
Real rate of return	0.87%

As of 12/31/23

Regardless of the investment, it is important to consider the inflation rate when determining what you are really earning on your money. For a more detailed understanding of how inflation impacts your portfolio, talk to your investment professional.

Keep in mind that CDs may be purchased for longer periods than illustrated. The six-month CD rate was used as an example to illustrate the effects of taking money out of the market because of volatility. Had longer-term CDs been used (such as a 60-month CD), the results would have been different. CDs are FDIC insured, generally up to \$250,000, and have principal and interest guarantees. Unlike most FDIC-insured CDs, the share price of the other investments (e.g., stocks, bonds, mutual funds) is subject to fluctuation and is not guaranteed. Therefore, there are greater investment risks involved, which may result in a loss of principal.

How Can Investors Manage Inflation

Inflation reduces the value of an investors investment returns and spending power. When inflation is high, investments need to work harder to help meet an investors long-term financial goals. If investors only hold more conservative investments like CDs, investors may need to review their investments to take on more risk to potentially generate higher returns in order to beat inflation. Historically, over the long-term, stocks and bonds have produced the higher level of returns than more conservative investment options like CDs, but also carry more risk.

Important risk considerations: Stock: Stock markets and investments in individual stocks are volatile and can decline significantly in response to or investor perception of issuer, market, economic, industry, political, regulatory, geopolitical, environmental, public health, and other conditions. **Bond:** Investments in debt instruments may decline in value as the result of, or perception of, declines in the credit quality of the issuer, borrower, counterparty, or other entity responsible for payment, underlying collateral, or changes in economic, political, issuer specific, or other conditions. Certain types of debt instruments can be more sensitive to these factors and therefore more volatile. In addition, debt instruments entail interest rate risk (as interest rates rise, prices usually fall), therefore the Fund’s share price may decline during rising rates. Portfolios that consist of debt instruments with longer durations are generally more sensitive to a rise in interest rates than those with shorter durations. At times, and particularly during periods of market turmoil, all or a large portion of segments of the market may not have an active trading market. As a result, it may be difficult to value these investments and it may not be possible to sell a particular investment or type of investment at any particular time or at an acceptable price. The price of an instrument trading at a negative interest rate responds to interest rate changes like other debt instruments; however, an instrument purchased at a negative interest rate is expected to produce a negative return if held to maturity.
